AirLoc Damping Pads "Pin" Vibration Down on Spirol Cold Heading Machines

Spirol International is a leading manufacturer of engineered fasteners, including shims, inserts, coiled pins, solid pins, and slotted pins. Carlo Salvi, world famous cold headers, used to manufacture solid pins at Spirol's headquarters in Connecticut, are inherently dynamic machines with vibrations occurring in all axis, especially at high production rates. By installing AirLoc 725 highly damped pads under these large cold headers, the transmitted and reflected vibration is reduced. This provides better quality parts through stable, leveled machinery and the ability to produce at higher rates of speed.

Let AirLoc help take the shake out of you production equipment with one of our engineered pads for reduced vibration and improved production rates.
